Description and Comments

A simple granite first floor storefront façade gives way to Colonial Revival architectural design on upper floors. Tall, 12 over 16 double-hung windows spanning multiple floors, the use of quoins and the string courses of stone marking the divisions between floors are all characteristic of the style. In a departure from the historical style but common to buildings in the Revival Style, the building is topped with a slate mansard roof with dormers. The south façade includes a limestone panel engraved with the store's name.

Description and Comments

A simple commercial structure in brown brick presenting four pairs of double-hung windows across the second floor. Ornamentation is limited to three strings of rowlocks (one between the first and second floors, one above the second floor windows, and one at the top of the parapet). The area above the second floor windows has been used for a mural depicting Indians hunting buffalo on the plains.

Description and Comments

The building presents a limestone second-floor façade above a series of all-glass storefronts. The storefronts are protected by an aluminum awning that stretches across the entire façade, effectively separating the glass storefronts from the stone façade above. At either end of the building, a pilaster of stone is covered with cast plates of metal that bear geometrical and foliate patterns reminiscent of some of Louis Sullivan’s designs particularly those on the flagship store in Chicago. The detail of these patterns contrasts with the simplicity of the second floor façade, which consists of a series of shallow arches framed by fluted pilasters. The corner of this frame is a simple rosette, the overall effect being similar to the millwork common in residential structures in the late 19th century. These design features are capped by a plain cornice of stone. A flag pole is centered atop the building, and metal brackets for a sign still protrude from the center of the second floor façade.

Photo ID: 113-1

Description and Comments

Red brick two-story commercial structure with residential or office space above. The original first floor storefront façades have been completely replaced along both LaSalle and Jefferson Streets. However, the second floor masonry is in very good condition. Original large window penetrations have been retained, and the original windows in the LaSalle street façade appear to be in place. Ornate brick work around the third floor windows and cornice remain in place, though pediments formerly extending above the parapet have been removed. A carved or cast rosette decorated the top of the parapet at the corner of the building.

Description and Comments

A façade of buff brick with exuberant Art Deco designs executed in terra cotta, the Roxy Theater is one of the few examples of the style in Ottawa. As with most buildings in the Commercial District, the second story façade is practically unchanged, including chevron-laden terra cotta coping and angled brick work with terra cotta details above the second story windows. It appears that the theater originally had a vertical sign centered above the entrance, as mounting hardware is in evidence above the windows. As with many theaters of the period, the central theater entrance was flanked by two storefronts. The theater entrance has been replaced with contemporary metal and glass doors and windows, and a flat marquee mounted above the entrance. The storefront to the south has been completely bricked over, retaining only a first-floor cornice of terracotta and some of the fabric associated with the original storefront at ground level. The storefront to the north has been completely replaced with contemporary windows and doors.

The façade of the southern portion of the building has been recently replaced by a plain buff brick wall with a single contemporary door.

Description and Comments

The home of American Legion Post 33 is a two-story brick structure with a raised basement. The building's simple rectangular massing includes a two-story portico that stretches across the entire main façade. The slightly raked portico roof sits atop a heavy entablature of brick, supported by four heavy brick pillars. The second story porch sports a simple metal railing that appears to date from the midca960s. The porch has two small windows spaced centrally on either side of the door providing access to the building. The sides and bottom of the porch deck have been wrapped with aluminum or vinyl.

The secondary facades present tall, regularly spaced windows on both the first and second floors. These have all been replaced with glass block. Recent pointing did not maintain the original mortar profiles, detracting from the building's appearance.

The porch beneath provides access to the building. Three entries are evenly spaced across the façade. The central entry and the one to its left each consist of a double door surmounted by a fan light. The right-side entry consists of two separate doorways, each topped by a separate fan light. Instead of a metal railing, the first floor porch is enclosed by a masonry wall approximately 3 feet high. This wall is interrupted by an opening in front of the right-hand entries which allows access to the porch from a ramp leading to the street.

Description and Comments

Single-story yellow brick commercial structure has a distinctive green tile mansard roof. The storefront appears to have been replaced in the 1940s, including black panels, expanses of plate glass and a slender canopy protecting the entire building front, periodically supported by wrought iron supports with foliate patterns.

Constructed as a parking garage per Sanborn.

Description and Comments

A simple, unadorned red brick commercial structure with office or residential uses above presents a plain façade and original three-over-one second-story windows. Although the first floor windows and doors have been obviously replaced, the original penetrations seem to have been maintained. The only ornament on the building is the barely-noticeable machicolations formed by the last four courses of brick beneath the coping stones of the parapet. An aluminum and fiberglass awning and a large lighted sign intrude on the building's façade, but both features can easily be removed, and therefore are not considered in determining the building's integrity.

Constructed as an auto sales and service facility.

Description and Comments

This structure appears to have been built as a service station. Painted brick appears at either end of the building while the central section is sheathed with vertical wood siding. Inoperable plate glass windows and contemporary doorways of metal and glass extend across the main façade, with the main entrance flanked by two colonial-style sconces. The building is capped by a mansard roof of gray asphalt shingles.

Extensive alterations to the original brick and glass structure.

Original design is obscured by contemporary modifications.

Description and Comments

Built in 1925 as a Salvation Army Citadel, this building of dark brown brick presents design elements common to the commercial style popular in the early 20th century. Simple masonry elements, including squares of cast stone and soldier and rowlock courses of brick serve as decorative elements. Although windows have been replaced the original penetrations have been maintained.

The main façade presents three bays, with the central bay set back about two feet. The main entrance is centered in the right-hand bay, and first-floor windows are centered in the other bays. The second story presents tall window penetrations centered in the side bays, while the central bay presents a group of three very narrow windows with a single shared sill of cast stone set above a cast stone plaque that reads "Salvation Army Citadel." Although it appears that the original raised letters have been chipped away, they are still legible. The parapets on these three bays are treated with simple square patterns formed by runs of rowlocks and headers with squares of cast stone at the corners. This treatment above the central bay includes the use of lighter colored brick to indicate the building's construction date.

The central bay's parapet ends with a simple pediment of brick; the other bays present stylized battlements consisting of a single merlon rising slightly from the center of the parapet. On the secondary façade, first floor presents regularly-spaced window penetrations; on the second floor, the window penetrations alternate with brick panels edged with the same arrangement of rowlocks, headers and cast stone squares that decorate the main façade.

Description and Comments

This two story brick structure has a distinctive and simple masonry façade, with a symmetrical arrangement of three penetrations on each floor. The first floor has a central doorway. Above the first floor, corbelling results in the second floor overhanging the first by about a foot. The windows in the second floor façade are surmounted by segmental arches of brick soldiers. The first and second floor windows in the right-hand bay appear to share a single penetration in the masonry wall; a spandrel of vertical wooden siding separates the two windows. The façade has been painted; pink paint was applied to the mortar joints, then red paint with a glossy finish to the brick faces. The soldiers above the second floor windows and a course of soldiers at the top of the corbelling between the first and second floors have been painted pale yellow.

The north side of the building presents a dependency at the rear of the building, resulting in an I-shaped footprint. The north side of the building is covered in aluminum siding up to the dependency, which is of brick and is painted white. A central entrance is flanked by windows on the first floor of this wing; each penetration is capped by a narrow awning of green metal. A stair and second-floor walkway of pressure-treated lumber provides access to second story spaces in both sections of the building.

Description and Comments

The 1019 portion of this building is a single-story 20th century commercial style storefront that maintains excellent integrity of design, materials and workmanship. The faces of the pale brown brick used for this structure present a smooth center section with a rough textured finish on either side. The simple running bond used for most of the building results in a checkerboard pattern of smooth and rough finishes on the parapet and the area beneath the storefront windows. At the edges of the building, stack bond three bricks wide create a columnar effect. The original arrangement of the storefront and entry are evident, though the door and windows appear to have been replaced.

The 1021 section of the building has the massing of an American foursquare, but done in completely contemporary materials: vinyl siding, dark aluminum or vinyl windows, and a textured asphalt shingle roof.

Although the buildings are clearly connected, because of the level of integrity of the storefront, the building as a whole will be considered contributing. Likewise, condition and integrity statements are based on 1019, not 1021.

Description and Comments

A simple industrial building of dark brick, on its primary façade maintains the original penetrations and distinctive truncated pediment. Although the use of diagonal wooden siding to fill the window and door penetrations detracts from the building's integrity, these materials can be removed and the building easily restored to its original appearance.

Description and Comments

This building's ribbon windows make the flat roof with projecting heavy cornice appear to float above the pale brown brick walls. An excellent example of the International Style applied to a small office building.

Description and Comments

A simple two-story brick apartment building with a raised basement. The brick structure is typical in its design: two projecting bays on either side of the main entrance, a string course of cast stone or limestone at the level of the first floor window sills, and decorative masonry features such as soldier courses serving as lintels or marking the division between the upper floor and parapet. Squares of cast stone provide applied ornament. Two features of the building are unusual—the ornate hood suspended over the main entrance and the construction of a bungalow on the roof of the building.

Description and Comments

Simple brick façade on this one-story building added in the late 20th century. Sometime thereafter, the single remaining window penetration was filled with brick.

Insufficient original features remain to allow the building to contribute to the district.

Architectural style is indeterminate, due to modifications to the main façade. Originally constructed to expand the neighboring stone cutting facility.

Description and Comments

Simple brick façade on this two-story building added in the late 20th century. A metal mansard-type hood stretches across the front of the building over the first-floor doorway and windows. Windows have been replaced on the first and second floors. The north side of the building maintains examples of the original windows and shutters.

Architectural style is indeterminate, due to modifications to the main façade. Originally a stone-cutters site / marble works.

Description and Comments

Fine example of a brick Queen Anne home appears to have retained all its significant features except for the cornice, which has been replaced by a wide plain band of wood or metal. Windows and doors, porch roof with supporting columns and pediment and copper flashing on the slate roof all appear to be original. The brick work laid in a plain stretcher bond and including a distinctive exaggerated angled pattern above the windows on the main façade, suggest that brick veneer was a later addition to the original frame construction.

Originally built as sheriff's home connected to the now demolished County Jail building.

HAARGIS No. 124336

The First Congregational Church, constructed in 1870, presents a Victorian church design that borrows liberally from the Gothic and Romanesque traditions. Romanesque features include reliance on the Roman arch and the use of semi-circular machicolations as cornices throughout the building. Gothic features include the use of stone-capped buttresses, the steeply pitched roofs and steeples. The red brick building with contrasting stone foundation and trim has clearly retained its integrity of design, materials and workmanship.

Description and Comments

Included in NPS# 73000710, Washington Park Historic District

HAARGIS No. 124335

Masonic Temple shows the application of Renaissance Revival stylistic characteristics to a simple brick structure. The building presents four bays, two of which join on the first floor to accommodate the main entrance. A flat-roofed portico over the main entrance is supported by simple Ionic columns on brick plinths. The heavy entablature of the portico continues along the front of the building, forming hoods over the windows in the remaining bays. The entablature is supported by pilasters and brick plinths on either end. Other renaissance revival motifs expressed in this building include the suggestion of quoins at the corners of the building, the regular window placement across the main façade, the use of arched windows on the top floor with bricks outlining the suggestion of spandrel panels between the floors. Finally, a heavy metal cornice and simple parapet cap the building's main façade.

Description and Comments

Included in NPS# 73000710, Washington Park Historic District

HAARGIS No. 124465

The design of this brick court house borrows heavily from both the Classical and Colonial Revival Styles. The use of red brick as the primary building material, pilasters to define the window bays, the elevated main floor and use of quoins are all colonial motifs. The prominent portico with simple fluted columns, entablature consisting of cornice, frieze and architrave, and pediment are all strongly classical design features commonly applied to public buildings during this period. The entablature encircles the entire building, with the use of the pediment repeated on all elevations, and the classically-inspired Roman arch is applied to all windows on the main floor, while the more common segmental arch is used on the lower floor windows.

Description and Comments

Brick auto service building with rounded corner maintains excellent integrity. All window and door penetrations appear to be original. Architectural details are limited to the use of various bond patterns (alternating groups of soldiers and headers) above the windows and doors and at the top of the parapet.

Description and Comments

HAARGIS No. 124619

The First Presbyterian Church presents a Victorian church design that borrows liberally from the Gothic and Classical traditions. Gothic features include reliance on lancet windows and the pointed arch. Other Gothic features include the use of stone-capped buttresses, the steeply pitched roofs and steeples. A classically-inspired cornice appears on the gable ends; the shape of the exaggerated cornice dentils are repeated in the multiple keys decorating the stone hoods of the windows. A wooden tower top with gothic details was added some time after the 1972 landmarks survey, which shows the tower unfinished.

To the rear of the church is a three-story 1929 addition in red brick that also maintains excellent integrity. Tower completed after 1972.

Description and Comments

The First Methodist Episcopal Church, constructed in 1866, presents a Victorian church design in brick that borrows liberally from the Romanesque and Gothic traditions. Romanesque features include reliance on the round Roman arch for windows and doorways, as well as for the machicolations forming the cornice on the gable end of the building. Gothic features include the use of stone-capped buttresses and the steeply pitched spires. Four of these buttresses extend beyond the roofline on the main façade and are capped with spires, serving as major design features.

Prior to 1940's, building clad with stone veneer, which was later removed.

Description and Comments

A symmetrical Art Deco building of brick and stone presents strong horizontal lines: First, a low foundation in concrete, then a course of smooth stone, then glass block windows topped by a string course of stone and a brick parapet with stone coping. The horizontal lines of the building are interrupted by the central entry, marked by the suggestion of limestone pilasters on either side. Curved glass block visually leads into the recessed entryway which maintains its original doors and fenestration. A simple flat awning covers the entry, above which the name of the paper stands in bold aluminum letters. The stone pilasters extend above the parapet, and between them courses of brick in stacked bond raked back towards a central expanse of limestone. Typical of the style, the pilasters, brick work and central stone expanse are of varying heights, creating a stair-step effect above the entry.

Description and Comments

HAARGIS No. 124617
 A three-bay classically-inspired façade of brown brick dates from 1912. This façade includes a simple pediment enclosing a broken pediment and roundel in brick. The second story bays each present a pair of double-hung windows surmounted by a fan light. Each of the resulting Roman-arches has an exaggerated keystone. A narrow string course of stone separates the second story from the first. The left-hand bay on the first floor presents an entryway of contemporary metal and glass, while each of the other two bays present a group of two double-hung windows arranged beneath a transom. The first floor bond pattern makes use of regularly-spaced courses set back from the wall's edge. The resulting visual effect suggests oversized masonry commonly used for the ground floor of classical buildings. Windows are original to the 1912 renovation. A portion of the west façade of the building is visible over the adjacent building and presents a wall of red brick with simple machicolations beneath a wooden cornice and an arched window opening with keystone, suggesting a much earlier initial construction

Description and Comments

HAARGIS Number: 124618

Excellent example of a temple-front Greek Revival Style residence in yellow brick. The entablature, the pediment formed by the simple extension of the building's roof over the portico, the multi-story columns supporting the pediment are all characteristic of the style.

Built by an early merchant of Ottawa who harbored runaway slaves. Stands within the boundary of the Washington Park Historic District, but is not listed as a contributing element and also does not contribute to the Commercial District.

Per Ottawa's Sesquicentennial--1837 to 1987, Section 9, Page 14, John Hossack House actually stood across the river in South Ottawa.

Description and Comments

Included in NPS# 73000710, Washington Park Historic District

HAARGIS No. 124474

Christ Episcopal Church is built in the Gothic Revival Style popular during the 19th century. Common Gothic design elements inform the structure, from the steeply-pitched gable-front roof, to the narrow lancet windows repeated use of the Gothic arch, buttresses with angled stone caps, and the copper-flashed tower roof and later alterations in 1881 - 1884.

Description and Comments

Included in NPS# 73000710, Washington Park Historic District

HAARGIS No. 124473

Built as his home, William Reddick's mansion is a grand expression of the mid-19th century conception of the Italian Villa. From the shallow hipped roof supported by ornate corbelled brackets attached to a broad cornice, to the heavily-hooded segmental arch windows on the second floor, a series of second-floor balconies and the contrast of deep red brick with buff-colored stone, the building has long been considered an important architectural resource.

Photo ID: 062-2

Includes a contributing two-story outbuilding, also with Italianate design features.

Description and Comments

A single-story structure has been remodeled a number of times, including enclosing a front porch and applying a stucco-like finish to the exterior walls. The extent of change to the original structure precludes listing the building individually, but comparison with historic photos shows that the massing and proportions warrant categorizing this building as a contributing structure.

Building stands within the boundary of the Washington Park Historic District. Built as First Church of Christ, Scientist.

Description and Comments

Simple single-story commercial structure maintains all original penetrations, though some have been inappropriately filled with wood or glass. The parapet has been covered with a mural depicting scenes from local. Some door and window penetrations filled with wood or block glass. These inappropriate changes are reversible.

Façade appears to have been applied to a pair of older commercial structures.

Description and Comments

Two-story brick front-gable residence typical of the period. Soffit returns and massing suggest the Greek Revival style, while the large porch with side entry are typical of later residential design.

The building's massing, window penetrations, and roofline are unchanged, but the building does not contribute to the Commercial District.

A side entrance with the street number 220-C suggests the building is now a multi-unit residential structure.

Description and Comments

Single-story brick professional building housing five offices. Originally constructed as a fuel station, a central office is set at an angle at the rear corner of the property. On either side is a wing set at 45 degrees extending to the end of the property line. Each office has an entrance to the parking area. The center office has a plate glass window on either side of the door; the offices in the wings have one window each. The flat roof is raked slightly towards the back of the building, feature typical of smaller commercial buildings constructed in the mid-twentieth century. The brick façade, windows and doors appear to date from the 1990s.

Description and Comments

A small single-story building of clay masonry block with a random ashlar patterned stone veneer on the main façade. That façade also presents a shallow porch with pediment supported by narrow piers. The design of the porch is not consistent with the building's original design, and the application of stone veneer and installation of replacement windows further detracts from the building's integrity.

Description and Comments

This building presents a number of design elements related to religious architecture, including a tower with the suggestion of crenellations and windows with gothic arches. However, this building of yellow brick has had windows filled in and a contemporary vestibule of glass wood and metal that detracts from the building's original design. Those changes and the application of vertical wooden siding to the masonry on the tower have detracted from the building's integrity of design, materials and workmanship.

Description and Comments

Two-story frame front-gable residence typical of the period. Soffit returns and massing suggest the Greek Revival style, while the large porch with side entry are typical of later residential design.

The building's massing, window penetrations, and roofline are unchanged, though the application of aluminum siding detracts from the building's integrity.
